Software Requirements Specification

Project: ProjectsHub (Monograph & Software Projects Management Platform)

Document Version: 1.0

1. Executive Summary

ProjectsHub is an open-source platform for universities to submit, review, archive, and showcase student academic monographs and software projects.

It provides two main functions:

1. **An internal workflow tool** for students to submit work and for professors to review and approve it.
2. **A public storefront** where visitors, university staff, and other students can search and view approved projects.

2. User Roles & Permissions

The system follows a simple 5-level hierarchy:

1. **Super Admin:** Manages the overall system and creates Faculty Dean accounts.
2. **Faculty Dean:** Manages their faculty and departments, and creates Teacher accounts.
3. **Teacher / Professor:** Reviews student submissions, provides feedback, and approves or rejects projects.The same work can also be done by a Faculty Dean.
4. **Student Leader:** Logs in using a Student ID, manages team members for group projects, creates drafts, and submits final work.
5. **Public Visitor:** Anyone online who can search, view approved projects, and download documents without logging in.

3. Functional Requirements

3.1. User Accounts & Security

1. **Student ID Login:** Students log in using their official Student ID and password.
2. **First-Time Login Rule:** The system forces students to change their default password on their first login for security.
3. **Account Creation:** Deans create Teacher accounts; Super Admins create Dean accounts.

3.2. Project Submissions

1. **Individual & Group Support:** Projects can be submitted by one student or a team. For teams, one **Student Leader** handles all edits and submissions. The submitted project by a Student Leader will automatically be also added/linked to the group members.
2. **Draft Mode:** Students can save drafts as many times as needed before making a final submission.
3. **Two Submission Types:**
    a. **Universal (All Students):** Requires a PDF file, title, abstract, keywords, defense date, and citation count.
    b. **Science (CS/Engineering):** Includes the Monograph PDF *plus* a GitHub link, live demo URL, app screenshots, and selected technology tags.

3.3. Review & Approval Workflow

1. **Teacher Assignment:** When a student submits a project, the Faculty assigns a Teacher to review it.
2. **Teacher Actions:** The assigned teacher can take three actions:
    a. **Approve**
    b. **Reject**
    c. **Request Revisions** (with written feedback).
3. **Version History:** If revisions are requested, the system keeps older versions (v1, v2) saved for academic records.
4. **Project Lockdown:** Students can edit their project freely until it is approved.
    a. **Once approved by a teacher or dean, the project is permanently locked from further editing.**

3.4. Notifications

1. The system sends notifications **only** when a project's status changes to **Accepted** or **Rejected**.

3.5. Public View Page & Search

1. **Public Access:** Anyone can view approved projects and download public documents.
2. **Instant Search:** Visitors can search and filter projects by keyword, technology tag, graduation year, or department.

4. Non-Functional Requirements

1. **Usability:** Clean and simple dashboard so students and teachers require no training to use the system.
2. **Data Integrity & Locking:** The system must strictly enforce that approved projects cannot be edited or deleted by students.

3. **Scalability:** The database structure must support future multi-university (multi-tenant) use as an open-source tool.
4. **Performance:** Fast search responses on the public storefront and smooth file uploads for large PDF monographs.
5. **Security:** Passwords must be encrypted, and non-approved draft projects must remain hidden from the public storefront.

5. Out of Scope for Version 1.0 (MVP)

1. Plagiarism or AI detection integration. -> Coming in v2
2. Email/SMS alerts (V1 uses simple in-app notifications).
3. Automatic masking of student private data (e.g., hiding Exam IDs publicly).
